

Splash Software Updates 2010

There are updates available for Meet and Team Manager. Major changes are:

- * Full unicode support in all applications
- * The Installer are fully compatible to the latest Windows versions and recommendations.
- * Pdf documents will be smaller, especially when you have multiple pages with graphics.

The download is now integrated in the GeoLogix Helpdesk site:

<http://helpdesk.geologix.ch/ProduktDetail/SW>. To login to this site, you can use your login from the Splash site, but the username has "sw" to begin. Example: user id **10999** becomes user id **sw10999**. The password is the same. On the main site <http://helpdesk.geologix.ch/> you can type in your contact email address and then you will get an email with your login details.

You should install the new versions in a separate directory. When you start the applications the first time, you have to activate it. For this you need access to the internet. Just use the same user id / password as for the login for the website. Once this is done, you can use the automatic update function for any further updates.

Meet Manager 11

The meet databases are compatible between Meet Manager 2007 and Meet Manager 11. So you can just copy the .MDB files to the new directories or use the backup / restore functions.

Team Manager 10

The database file is compatible between Team Manager 2009 and Team Manager 10. You can use backup / restore to move your data to the new version or you just replace the empty Team10.mdb file with your Team2009.mdb from the old version.

If you want to restore from an automatically created backup, you have to open the .zip file with an archiving tool and extract the .mdb file to the Team Manager data directory and rename it to the referenced database file (normally Team10.mdb).
